

# Database search overview

Eng et al (1994) *J. Amer. Soc. Mass Spectrom.* 5: 976-989.

# Error Rate Assessment Methods

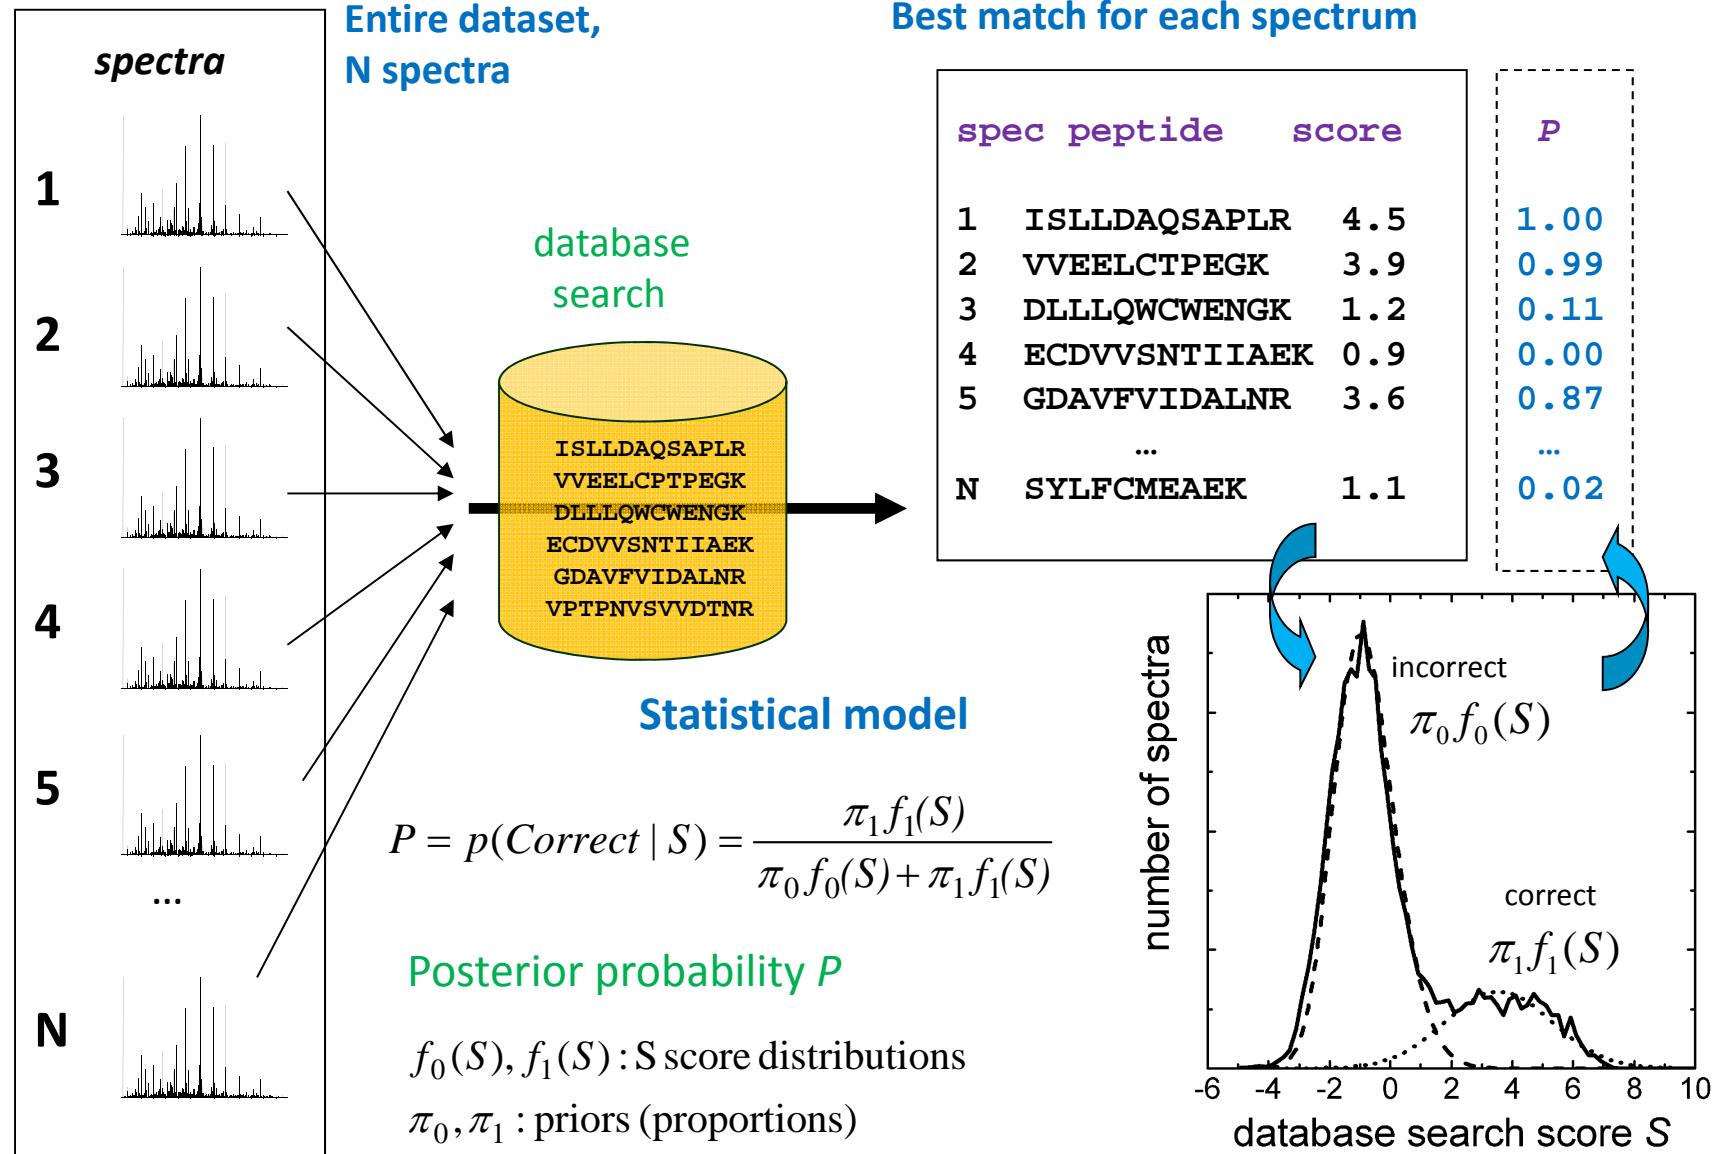

Commonly used methods:

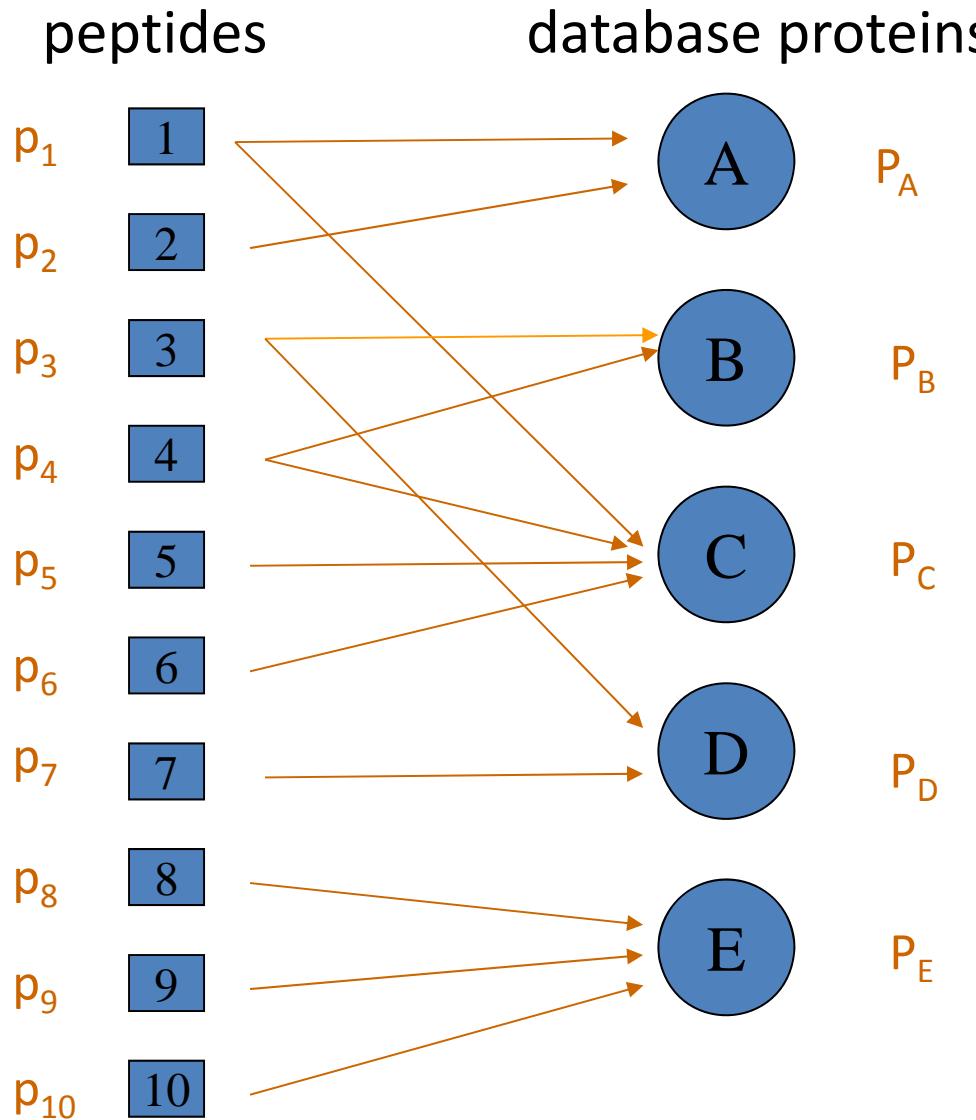

1. Target-decoy database searching (global FDR)
2. Statistical modeling, e.g. PeptideProphet (probability – localFDR)

A.I. Nesvizhskii, O. Vitek, R. Aebersold  
Analysis and validation of proteomic data generated by tandem mass spectrometry  
Nature Methods 4, 787-97 (2007)

# Mixture Model-based Methods

# Protein Inference

Task for computational tools:

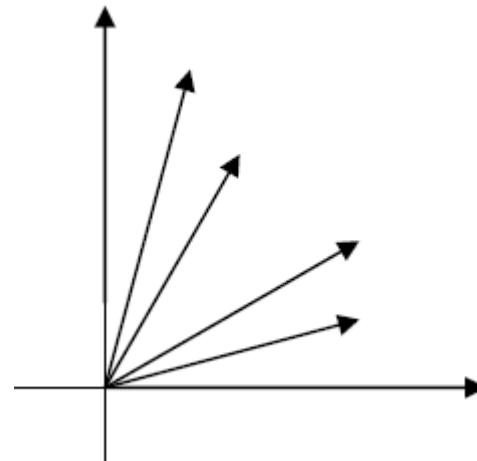

Probability-based model that aims at deriving minimum list of proteins that can explain all observed peptides

Resolve ambiguous cases (when possible) and presents results in a convenient “biologist-friendly” format

# Spectral Library Matching

- SQRT normalization of intensities boosts small peak value in matching.
- Dot products of spectra are related to angle between two vectors.
- A smaller angle is a better match.
- Recognizing *chimeric* scans becomes feasible.

$$\cos(A, B) = \frac{A \bullet B}{\|A\| \|B\|}$$

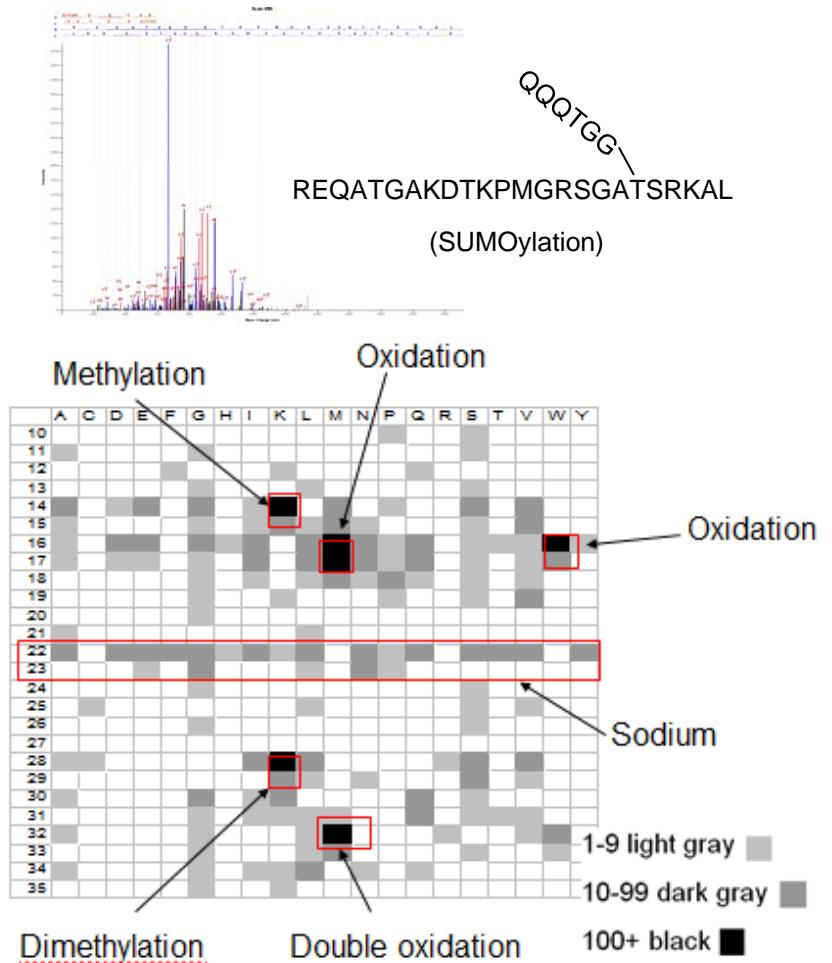

Stein and Scott, JASMS (1994) 5: 859-866.

Wang et al, Mol. Cell. Proteomics (2010) 9: 1476-1485.

# Exotic PTM Recognition

- Profiling PTM spectra recognizes distinctive fragmentation patterns.
- Sequence tags discover PTMs of unknown mass and specificity.
- Patterns of mass shifts reveal dominant PTMs in samples.

Bandeira et al, *PNAS* (2007) 104: 6140-6145.  
Dasari et al, *Chem. Res. Tox.* (2011) 24: 204-216.
