

## Photoionization Workshop Summary

### “New Developments in Photoionization”

64<sup>th</sup> ASMS Conference on Mass Spectrometry and Allied Topics, San Antonio, TX

Wednesday, June 9, 5:45 – 7:00 pm, Room 225C

Organized by: Jack Syage and Ralf Zimmermann

Ralf and I opened with a brief overview of the highlights of the year in photoionization and then we introduced four discussion leaders:

- “Implementation of APPI MS for Organometallic Compounds”  
Noam Tal, Tel Aviv University, Israel
- “Compact Laser Desorption/Ionization TOFMS for Planetary Missions”  
Xiang (Shawn) Li, University of Maryland
- “APPI Dopants for DART”  
Chip Cody, JEOL
- “Online Photoionization TOFMS Studies on the Catalytic Pyrolysis of Bituminous Coal”  
Yang Pan, University of Science and Technology, Shanghai, China

The workshop demonstrated continued strong interest in the subject matter as it attracted a large audience (about 60 people), but not as large as last year (about 100 people). We think this may be due to the switch from Mon to Weds evening and also there seemed to be more workshops this year. It may not have helped that for the second straight year the beer dispenser on our floor was not ready by the 5:45 pm start time.

Each of the discussion leaders kept to their 5-10 min allotment of time, which allowed for plenty of discussion. On the whole there was a high quality of audience participation as evidenced by strong and rigorous discussion on the varied topics. We heard positive feedback from many attendees.

I also announced that I will be stepping down as co-chair. We have a couple of highly qualified candidates to replace me.

The briefing material is attached.

# New Developments in Photoionization (APPI/PI)

**Wednesday, June 9, 5:45-7:00 pm**

**Room 225C** (San Antonio Convention Center, TX)

Organized by Jack Syage and Ralf Zimmermann

## Discussion Leaders

- “Implementation of APPI MS for Organometallic Compounds”  
Noam Tal, Tel Aviv University, Israel
- “Online Photoionization TOFMS Studies on the Catalytic Pyrolysis of Bituminous Coal”  
Yang Pan, University of Science and Technology, Shanghai, China
- “APPI Dopants for DART”  
Chip Cody, JEOL
- “Compact Laser Desorption/Ionization TOFMS for Planetary Missions”  
Xiang (Shawn) Li, University of Maryland

## Benefits of PI and APPI

- **Ionizes a wide range of compounds (polars to non-polars)**
  - Wide bandwidth ionizer
- **Lower susceptibility to ion suppression than ESI or APCI**
  - Simpler clean-ups mean ease and better recoveries
  - Use with faster chromatography and even flow injection analysis
- **Large linear dynamic range**
  - Great for quantitative analysis

**Can APPI and PI be a mainstream technologies or are they best suited for niche applications?**

---

# APPI for Explosives and Narcotics Trace Detection

## Morpho Detection

IT4DX IMS

## Implant Sciences

QS-B220 IMS

## Bruker

DE-tector IMS

MS ETD

## 1<sup>st</sup> Detect

## Why not APCI

Discharge sources in air create atmospheric  $\text{NO}_3^-$  ions that interfere with  $\text{NO}_3^-$  nitrate ions from nitrate explosives

## PI for on-line detection and GC applications

- Many PI-MS applications for on-line detection (Laser- or Lamp-PI) or as detector for gas chromatography or thermal analysis
- Vacuum ionization: No susceptibility to ion suppression but lower sensitivity than EI
- Now systems are becoming commercially available....

Photonion  
(TG-PIMS, on-line, GC-PIMS)

Hexin  
(on-line)

Jeol  
(GC-PIMS)

➔ Development of vacuum PI sources for GC-/GCxGC-HRTOFMS Systems

# **Implementation of APPI for Organometallic compounds**

Noam Tal, Tel Aviv University, Israel

# Organometallic compounds

# Organometallic compounds

- Hafnium complexes mostly used as catalyst for alpha olefine polymerization resulting industrial polymers such as polypropylene.
- Extremely reactive and sensitive (oxygen, moisture)
- Covalent and coordinative bonds.

## **APPI conditions:**

- MS: SYNAPT, Waters.
- UV Lamp: Syagen 10.6 ev krypton discharge Lamp
- Repeller 0.8-1.2 KV
- Sampling Cone 40
- Extraction Cone 4
- DCM/MeCN + 1-10%Toluene, Acetone
- Desolvation temp: 300-400 °C

Flow: 500-750 L/h , 99.9% Dry Nitrogen

# Organometallic compounds

# **Summary**

1. APPI is suitable to organometallic compounds that can't be analyzed using ESI, and decompose in EI.
2. High sensitivity both in positive and negative modes
3. Provides additional information compared to ESI.  
(labile ligands or counter ions)
4. Broaden capabilities of API source.

**A cheap, portable light source with higher photon flux is critically needed.**

# Thank you!

## Short topic 1: GCxGC/HRTOF with PI source

# GC-PI-HRTOFMS system

AccuTOF GCv4G + PI (proto type)

Agilent 7890 equipped with  
Zoex thermal modulator for  
GCxGC

AccuTOF GCx + PI (product type)

# Fragment ions can confuse biomarker analysis, even with GCxGC and HRMS

- “...SIM is affected by interference. For example,  $C_{28}$  steranes can lose a methyl group (15 amu) during ionization, resulting in a fragment at  $m/z$  371. However, some 372 will also result from the  $C_{28}$  steranes because heavy isotopes of carbon ( $^{13}C$ ) or hydrogen (D) are also present.”

**The Biomarker Guide: Volume 1, Biomarkers and Isotopes in the Environment** ...By K. E. Peters, C. C. Walters, J. M. Moldowan

Cambridge University Press, Aug 16, 2007

# $C_{27}H_{48}$ ( $m/z$ 372.3756) extracted ion chromatograms

Using the FI and PI data, the isotopic ion of demethylated fragment ion  $C_{27}H_{47}$  interference from  $C_{28}H_{50}$  disappeared as a result of FI and PI producing minimal fragment ions in the mass spectrum. The GCxGC/FI and GCxGC/PI EICs made it much easier to interpret the data and correctly assign the biomarker identities in crude oil samples.

# GCxGC/PI

- Abundant molecular ions
- More sensitive than FI for some compounds
- Much less fragmentation than EI, but more fragmentation than FI
- Interfering fragments eliminated for biomarker analysis, but characteristic fragment for hopanes, cholestanes etc. allows us created chromatograms for

## Short topic 2: Argon DART

**“This is a photoionization work  
Why is he talking about DART**

DART is usually done with helium or nitrogen.

What about argon?

- $\text{Ar}^*$  doesn't ionize water
- Only 2 papers used argon for DART. Both used proton transfer dopants (AcAc/pyridine, or absolute ethanol)
- PAH's have a low ionization energy, but results were inconsistent.
- The 11.55 eV internal energy of  $\text{Ar}^*$  is close to the 10.6 eV photon energy of krypton lamps used for atmospheric pressure photoionization (APPI).  
Use APPI Dopants!

**The 11.55 eV internal energy of  $\text{Ar}^*$  is close to the 10.6 eV photon energy of krypton lamps used for atmospheric pressure photoionization (APPI). Use APPI Dopants!**

**Detailed Analysis:  
L2MS Mode**

Selectively ionize PAHs →

- Soft ionization has great potential to be used in future space missions requiring the careful analysis of complex organics in planetary surface materials.
- The ExoMars Rover will carry the MOMA instrument, which will use photoionization as ion source for the first time for in situ analysis of planetary surface chemistry beyond Earth.
- Other photoionization sources can be considered for future instruments, e.g., miniaturized VUV laser or lamp, tunable wavelength laser..... subject to the unique environmental constraints imposed by space flight!

# Requirements for space missions

## Goal (simplified!)

- Detect intact organic molecules – e.g., by soft ionization mass spectrometry

## Instrument itself

- Clean design – compatible with strict contamination and planetary protection requirements
- Compact – low power, low volume, and low weight
- Operable in harsh environments
  - Radiation
  - Temperature extremes – environments range from cold ( $\sim 100$  K) to hot ( $\sim 500$  C)
  - Dust and particulate challenges
